Target workspace tree (names only) + move order

Repo root: `Cursor Workspace PDE/` (unchanged name; still your Cursor folder).

Literal target tree

└── (other legacy / outputs / big_dfs / … unchanged in this phase)
```

Move order (executed)

1. Create `tenure/`, `sports/`, `talent/`, `archive/`.
2. **Tenure:** move `tenure_pipeline/` → `tenure/tenure_pipeline/`; symlink `tenure_pipeline` at root → `tenure/tenure_pipeline`.
3. **Tenure:** move `540_*`, `541_*` notebooks → `tenure/`; symlink `540_tenure_pipeline.ipynb` at root → `tenure/540_tenure_pipeline.ipynb`.
4. **Tenure:** move `current_documents/tenure_documents` → `tenure/documents`; symlink `current_documents/tenure_documents` → `../../tenure/documents` (relative).
5. **Sports:** same pattern for `sports_pipeline/`, `530_*.ipynb`, `sports_documents`.

6. **Talent:** same for `talent_pipeline/`, `talent_documents`.
7. `run_stage3b_cli.py`: move to `tenure/` and point default notebook at `tenure/540_tenure_pipeline.ipynb`; optional symlink at root if desired.

Why symlinks at root?

CELL 0 uses `WORKSPACE_ROOT / 'tenure_pipeline'` with `WORKSPACE_ROOT = Path('.').resolve()` = repo root when you run from root. Moving the real folder to `tenure/tenure_pipeline` without changing the notebook requires either:

- **Symlink** `tenure_pipeline` → `tenure/tenure_pipeline`, or
- A **large CELL 0 edit** to use `tenure/tenure_pipeline` everywhere.

Phase 1 uses **symlinks** so nothing in `540_tenure_pipeline.ipynb` breaks. If Dropbox ever mis-syncs symlinks, switch to explicit paths in CELL 0.

Next phases (not automatic)

- Move `obsolete_*`, `deleted_files`, `zips` into `archive/` when you are ready.
- `git init` + `.gitignore` per `WORKSPACE_CLEANUP_ROADMAP.md`.
- Optional: relocate `python_packages/` under `shared/` and update CELL 0 (later).

Created as part of physical cleanup, April 2026.
