

Club Team Preference Choices

Interest discipline centroids  
- Even better if all in different quadrants

each individual has  $d_a, d_n, d_m$  their distance to the topic centroids

this is the model we use for metadata club attachment

People are drawn to groups based on where they lie in this 2D plane

If I lie together I want a group focused on art history.

Even better we have an  $N$ -dimensional space ~~for~~ with each topic being another ~~dimension~~ dimension.
