

COMPASS — sim re-entry status (2026-07-27)

Audience: Charles, future agents
Scope: Basketball generative sim only — not tenure/Army.

What changed

- 1. Document re-entry (01-03 + `Model.pdf`) — unchanged intent; p replaces τ in assignment prose.
- 2. Sim re-entry: old lab notebooks → `sports/archive/`; active surface = `540_*` + scripts.
- 3. Assignment knob: user-facing p (assortativity); $p=0$ = max mixing; $p\uparrow$ = sharper soft match. Legacy τ in archived docs only.
- 4. Preferential attachment: `USE_PREFERENTIAL_ATTACHMENT` boolean (default off).

Experiments

Pass	Question	Status	Export
A	Congestion in S_i ? ($\lambda=0$ vs $\lambda>0$)	Done	<code>alex_side_by_side_v0/</code>
B	Assignment sorting moves readout? (p low/high/chop)	Done	<code>alex_rho_ablation_v0/</code>

Claims guard (v1):

- Pass A proves congestion in **selection** can bend curves — not hero bin-for-bin match.
- Pass B shows assignment sensitivity with selection fixed — not proof NBA uses p .
- Sort-and-chop is a **benchmark**, not $p\rightarrow\infty$.

Execution order

See `re_entry/model_OPORD.md`.

Agents

- Charles + Cursor agent own archive + 540 implementation.

- **SCOUT:** archived notebooks = reference only; no handoff required.
- **COMPASS:** this stub + claims guard; no domain coding.
