

DISPOSABLE — Alex hero / F-HERO population thread (2026-08-25)

Purpose: One place after Alex meeting — population lock, plot provenance, CLI sweep order.
Companion: `_DISPOSABLE_CCT_P2b_workflow_thread.md` (band overlay / knees).
Say `anchor` in chat to paste YOU ARE HERE.

YOU ARE HERE

Step	Task	Status
0	Alex meeting captured (this doc)	✓
1	Plot provenance strip on HERO + F-HERO	✓ code + sandbox
2	Lock ever-draft for Alex sweep	Pending (run sandbox #0)
3	Recreate F-HERO with provenance	Pending (run sandbox #0)
4	Sweep QTL vs EW (display only; two CLI runs)	Pending
5	Sweep 2013–2021 vs 2011–2021	Pending
6	Div I / II filter	SCOUT active (Charles, Aug 25)
7	Sweep ALLT vs DFT (Alex: DFT ok for distributions, suspect for hero)	Pending

Prime directive (Alex + Charles): Before changing any knob, ask *why would I change x→y, and is that change worth looking at?*

A — Two plots (do not conflate)

Name	Script	X-axis	Y-axis	Deck ref
HERO	<code>pass_a_empirical_bundle.py</code>	<code>poolq_loo</code> (LOO teammate perf)	mean <code>Y_draft</code> · 16 bins	OLD_vs_NEW slides 2–3 top-right
F-HERO	<code>pass_a_congestion_conditional.py</code> <code>--plot fixed_ai_tj_knbins</code>	<code>T_j_hat</code> (team mean perf, incl. self)	mean <code>Y_draft</code> · piecewise <code>T_j</code> bins	<code>Fixed_Ai_Comparisons</code> Slide 10

Not the same axis. HERO = LOO pond. F-HERO = team mean `T_j`.

B — Alex meeting notes (consensus)

- Band overlay / lower-band knees moving right — Alex’s first read: **Wilson intervals huge** on those knees → low n / thin bins; don’t over-interpret point estimates.
- LOO vs mean — HERO is already `poolq_loo`; F-HERO is `T_j` (team mean). Label explicitly on figures.
- Binning — pick QTL vs EW with justification; can run both for display; Alex ok either way if labeled.
- +DFT — good for **distributions**; may **bias hero** curves → report **ALLT vs DFT** side by side for hero/F-HERO, not DFT-only as default.
- Division I / II — Charles: consider restricting; check how many D-II draftees; may drop D-II too. **Panel has no `division` column today** — needs lookup or external list.
- Season window — Alex **asked about** 2011–2012 / 2013–2021 (did **not** suggest switching). **2013–2021 = sweep only**, not primary until paired run says otherwise. See §B2.
- Season-Y (`y-draft-mode season`) — **park for Alex sweep**; keep in code; label when used. Default sweep = **ever-draft**.
- Provenance on plot — all switches visible on figure; filenames stay short.

B2 — 2013–2021: primary or not?

Code already knows both windows (`pd20_22_campaign_window.py` : full 2011–2021; primary 2013–2021 tagged `_13_21` for AUTO decks).

What “funky” refers to (honest sourcing)

Claim	Source	Detail
“2011–2012 funky”	Alex meeting (Charles memory, Aug 25)	Not a formal 2011–2012-only audit in repo
2013→2014 ESPN break	Documented (PD22, Aug 17)	Raw player-season count +83% (5,801→10,633); games only +3%; ESPN listed deeper box scores (~+2 rows/game/team). Breaks ppm0lt20 ρ panels; min-20 hero barely moves (+2.7% player-seasons 2013→2014)
Early scrape / fragments	BOX QC memos	Dash placeholders, D-II one-game cameos — worse in raw early years but QC + mg10 already scrubs most

Should 2013–2021 be primary?

For	Against
Alex asked (exploratory, not a recommendation)	All locked hero decks / alex_side_by_side_v0 use 2011–2021
Avoids pre/post 2014 box-depth regime mix in longitudinal work	HERO at min20 + QC is stable across 2013→2021
Cleaner p / H_sort story if you keep ppm0 panels	Dropping 2011–2012 loses 2 seasons of draft rows (~small at hero n)
Already wired as PRIMARY_SEASON_MIN in campaign window	Need paired 11_21 vs 13_21 hero + F-HERO before locking

COMPASS read: 13–21 = sweep only (Alex asked; did not suggest). Default stays 11–21 until paired HERO+F-HERO shows material shape change. Sweep #3 in §E.

C — Plot provenance strip (target)

Footer or subtitle block (8–10 pt), e.g.:

HERO · poolq_loo (L00) · bins=QTL16 · PPM z · 2011–2021 · min0 mg10 · ALLT · Y=ever · winsor 1–99%

F-HERO · $\hat{T}_j$ (team mean, incl. self) · piecewise 4+7 · top7% $\hat{A}$ · +DFT · min20 · 2011–2021 · Y=ever

Always write matching JSON with same keys (already partial on F-HERO / season-Y).

D — Filename policy (Charles 2026-08-25)

Always in filename (even when = default — Charles can’t remember defaults):

- Plot family (HERO / CCT_FHERO)
- Binning + count: q16 / ew16 / F-HERO pw4p7 (piecewise 4+7)
- Seasons (11_21 / 13_21)
- Population (allt / dft / later div1)
- min{N} · mg{N}

Plot footer + JSON only: Y mode, last_ps , winsor, perf metric spelled out, axis (LOO vs T_j), n/drafts.

Locked defaults (reference): HERO q16 quantile · min20 · mg10 · winsor 1–99% · 2011–2021 · ever · ALLT · ppm.

E — CLI sweep order (Charles runs)

Defaults for sweep: --y-draft-mode ever · no season-Y · provenance after step 1.

#	Change	HERO command sketch	F-HERO command sketch
1	Baseline lock	pass_a_empirical_bundle.py (locked or explicit min20 mg10)	pass_a_congestion_conditional.py --plot fixed_ai_tj_knbins --dft --p2b-single --min-minutes 20 --ai-top-pct 7 --tj-n-low 4 --tj-n-high 7
2	EW vs QTL	add --poolq-binning equal_width (second PNG)	F-HERO binning already piecewise; note in doc
3	13–21	--season-min 2013 --season-max 2021	same season flags
4	ALLT vs DFT	omit vs --dft	omit --dft vs --dft
5	Div filter	blocked until division map exists	same

Season-Y experiment folder (pass_a/season_y_experiment/) — do not overwrite canonical Alex sweep artifacts.

F — Division (SCOUT active)

Owner: SCOUT thread (Aug 25) — Charles delegated; not blocked on COMPASS/this thread.

Prior repo context (pre-SCOUT): June 2026 Div-I thread; SCOUT BOX QC memos. Panel has no division column today; prior quant ~0 D-II/D-III draftees in matched lookup.

When SCOUT lands: wire --div1 / --div12 (or equivalent) → sweep #5 in §E. Until then, skip div rows in sandbox matrix.

H — Population sandbox (target layout)

Goal: fiddle HERO + F-HERO pairs until population locks — without clobbering canonical pass_a/ or basic_data_plots/ artifacts.

Proposed root: 3-Master_Plan/re_entry/HEROs_and_PASSes/population_sandbox/

population_sandbox/
 README.md
 hero/
 fhero/
 pairs/

← sweep matrix + “locked population” when chosen
← pass_a_empirical_bundle outputs
← pass_a_congestion_conditional F-HERO outputs
← optional side-by-side PNGs for deck

Wire scripts with `--output-root` or env once provenance strip lands; until then, manual `--output-tag` + copy.

I — Parked after population lock (Charles: don't forget)

SI descriptive slides — distributions (ability, poolq_loo, T_j, minutes, draft rate by subgroup, etc.) on the **locked** population. Not Alex-deck blocking; paper SI pass.

G — Parked (not Alex-blocking)

- Season-Y hero (`y-draft-mode season` , `last_ps`) — built; use when estimand discussion matures.
- Overlay knee automation / formal θ .
- `_DISPOSABLE_CCT_P2b_workflow_thread.md` §I null knee migration.

Thread log

2026-08-25 — Alex meeting debrief + Charles corrections

- Wilson CIs on lower-band knees; LOO vs T_j; QTL vs EW; DFT bias on hero; provenance on plots; variable discipline.
- **13–21**: Alex asked about early seasons; **did not suggest** switching — sweep only.
- **Division**: SCOUT working separately (Charles).
