

Talent (Army) workspace — layout, symlinks, and AWS exports

Audience: You (and agents) when working on 501–520 officer pipelines, Cox helpers, and advisor-driven changes.
Canonical doc home: this folder = `talent/documents/` (also reachable as `current_documents/talent_documents` → symlink at repo root).

1. Where the “real” code lives

- **Package / notebook tree:** `talent/talent_pipeline/`
(notebooks like `520_pipeline_cox_working.ipynb`, `cox_plot_helpers.py`, `pipeline_config*.py`, `py_503_hierarchies.py`, etc.)
 - **Why you also see `talent_pipeline` at the repo root**
At the **Cursor / repo root** there is a **symbolic link**:
 - `talent_pipeline` → `talent/talent_pipeline`That keeps **CELL 0** and scripts that assume paths like `WORKSPACE_ROOT / 'talent_pipeline'` (with `cwd` = repo root) working after the **April 2026** physical move of code under `talent/`. The same pattern is used for **sports** and **tenure** (`sports_pipeline`, `tenure_pipeline`).
 - **You are not maintaining two separate copies** — one directory is canonical, one is a **compatibility link**.
- Design reference:** `tenure/documents/TARGET_WORKSPACE_TREE.md` and `tenure/documents/WORKSPACE_CLEANUP_ROADMAP.md` (Phase 3).

2. `talent/Army_AWS_download/`

- **Role:** Staging area for **snapshots of “live” code** pulled from the **Army AWS** environment (e.g. `TALENT_NET_export_YYYYMMDD-hhmm/`) so you can **diff, merge, or reapply** changes **locally** in step with advisor guidance.
- **Not** the day-to-day working tree: treat it as a **source for comparison** until you explicitly fold files into `talent/talent_pipeline/`.
- **Ground truth (Charles, April 2026):** Everything **outside** `Army_AWS_download/` is authoritative for local work; upload **from** `talent/talent_pipeline/` to Army AWS live when ready.
- **After merging:** note in your commit or lab notebook which export folder you aligned to (avoids “which 520 is truth?” later). Pre-overlay backup example: `obsolete_files/talent_pre_bar_stratify/talent/`.

3. Agent conversations, SpecStory, and COMPASS

- **SpecStory** stores portable chat history under `.specstory/history/` in the repo (dated `*.md` files). Charles wants **full history tracked in git** (not ignored).
- Use SpecStory when you need the **narrative** for why a move or symlink was made; the **architectural** answer is still `tenure/documents/TARGET_WORKSPACE_TREE.md`.
- **Cross-project master plan (2026):** Charles is assembling a **COMPASS** agent (Cursor) fed by **3-Master_Plan/{AGENT}_report_to_COMPASS.md** from **CODA** (`talent/`), **SCOUT** (`sports/`), **PEER** (`tenure/`), and **VECTOR** (`5-Manuscript/`). CODA's report: `3-Master_Plan/CODA_report_to_COMPASS.md`. Planning work starts **only when Charles assigns** that agent.

4. Quick path cheat sheet

You want	Path
Edit 520 / helpers	<code>talent/talent_pipeline/</code> (or <code>talent_pipeline/</code> at root — same files)
Handoff / Cox / Coda memos	<code>talent/documents/</code>
Compare to AWS	<code>talent/Army_AWS_download/TALENT_NET_export_*/</code>
COMPASS handoff (CODA)	<code>3-Master_Plan/CODA_report_to_COMPASS.md</code>
Workspace move rationale	<code>tenure/documents/TARGET_WORKSPACE_TREE.md</code>

Coda, April 2026 — adjust dates or export folder names as your snapshots change.
