

Beau_guide bundle

Self-contained folder under `Ivy_Net/5-Manuscript/Beau_guide/`. Maintainer: Charles.

Everything Beau needs for **Slurm + notebook pipeline onboarding**, plus reference copies of scripts the `540` notebook or `pipe_job` workflow mentions. Filenames use `_beau` (documents / primary Beau scripts) or `_reference_beau` (verbatim-ish copies from elsewhere in Ivy_Net for comparison).

Read first

File	Purpose
<code>HPC_SLURM_PIPELINE_GUIDE_beau.md</code>	Full Rivanna walkthrough (stdout/stderr, <code>tail -f</code> , <code>sbatch</code> , placeholders).
<code>pipe_job_beau.slurm</code>	Annotated batch job — edit <code>YOUR_*</code> , then <code>sbatch</code> from Ivy_Net root.

Notebook format example

File	Purpose
<code>540_tenure_pipeline_beau.ipynb</code>	Copy of <code>tenure/540_tenure_pipeline.ipynb</code> — shows Cell 0 paths, <code>RUN_CELL*</code> flags, and skip/reload pattern. <code>pipe_job_beau.slurm</code> defaults <code>NB_IN</code> here so Beau can execute the example without touching production paths (still requires full Ivy_Net tree + conda deps).

Beau scripts (primary)

File	Purpose
<code>pipe_job_beau.slurm</code>	Batch-execute <code>NB_IN</code> with papermill/nbconvert.
<code>track_slurm_beau.sh</code>	<code>tail -f</code> on <code>slurm-*--<JOBID>.err</code> — repo root + Beau_guide aware. <code>chmod +x</code> once.

Reference scripts (Charles / notebook-mentioned)

Same contents as upstream paths unless noted — rename only so this folder stays grep-friendly.

File	Upstream / notes
<code>pipe_job_reference_beau.slurm</code>	Repo-root <code>pipe_job.slurm</code> — minimal Charles launcher.
<code>track_slurm_reference_beau.sh</code>	<code>scripts/track_slurm.sh</code> — minimal <code>tail -f</code> helper (expects logs in repo root).
<code>build_openalex_cache_reference_beau.slurm</code>	Repo-root <code>build_openalex_cache.slurm</code> — 540 mentions <code>sbatch build_openalex_cache.slurm</code> .
<code>apply_url_updates_reference_beau.sh</code>	Repo-root <code>apply_url_updates.sh</code> — referenced in notebook session log comments.
<code>myjob_reference_beau.slurm</code>	Repo-root <code>myjob.slurm</code> — conda env bootstrap pattern (sometimes cited when conda env missing).

Environment template

File	Purpose
<code>.env.example_beau</code>	Copy of repo <code>.env.example</code> . Copy to Ivy_Net repo root as <code>.env</code> (never commit secrets); notebook loads <code>OPENALEX_*</code> etc. from there.

Commands (from Ivy_Net repo root)

```
# one-time
chmod +x 5-Manuscript/Beau_guide/track_slurm_beau.sh

# submit
sbatch 5-Manuscript/Beau_guide/pipe_job_beau.slurm

# watch stderr
./5-Manuscript/Beau_guide/track_slurm_beau.sh <JOBID>
```

Canonical copy of this guide may also be updated at `tenure/HPC_SLURM_PIPELINE_GUIDE.md`; `HPC_SLURM_PIPELINE_GUIDE_beau.md` here is the bundle-local duplicate.
