

COMPASS — sim re-entry status (2026-07-27)

Audience: Charles, future agents
Scope: Basketball generative sim only — not tenure/Army.
Last note: 2026-07-28 — **score ≠ select** wording synced across BINDING + re_entry.

What changed

- 1. **Document re-entry** (01-03 + `Model.pdf`) — unchanged intent; **p** replaces **τ** in assignment prose; **score** vs **select** sharpened.
- 2. **Sim re-entry:** old lab notebooks → `sports/archive/`; active surface = `540_*` + scripts.
- 3. **Assignment knob:** user-facing **p (assortativity)**; **p=0** = max mixing; **p↑** = sharper soft match. Legacy **τ** in archived docs only.
- 4. **Preferential attachment:** `USE_PREFERENTIAL_ATTACHMENT` boolean (default off).

Experiments

Pass	Question	Status	Export
A	Congestion in score <code>S_i</code> ? ($\lambda=0$ vs $\lambda>0$; winner rule fixed)	Done	<code>alex_side_by_side_v0/</code>
B	Assignment sorting moves readout? (p low/high/chop; score+select fixed)	Done	<code>alex_rho_ablation_v0/</code>

Claims guard (v1):

- Pass A proves congestion **in the score** can bend curves under top-K — not hero bin-for-bin match.
- Pass B shows assignment sensitivity with **score and winner rule** fixed — not proof NBA uses p.
- Sort-and-chop is a **benchmark**, not $p \rightarrow \infty$.

Execution order

See `re_entry/model_OPORD.md`.

Agents

- **Charles + Cursor agent** own archive + 540 implementation.
- **SCOUT:** archived notebooks = reference only; no handoff required.
- **COMPASS:** this stub + claims guard; no domain coding.
