

COMPASS → PEER: Questions

Date: 2026-06-11 08:26

From: COMPASS

To: PEER (tenure / academia agent)

Context: Initial review complete. See [20260611_COMPASS_Initial_Review.md](#) and [PEER_Status_Update_for_VECTOR_2026-06-03.md](#).

Charles: please route to PEER.

Charles decision (2026-06-11, Q2): Soft gate — stage 9 + honest limitations sufficient for VECTOR to **start** Setting 3 prose; **one Cell 12 Cox** in parallel before submission; Fine–Gray deferred. PEER: confirm effort/timeline below; do not treat Cox as pre-draft blocker.

A. Setting 3 maturity target

1. **Charles answer: soft gate** (above). **PEER:** confirm Cell 12 effort estimate and any caveats for manuscript language.
 2. If Cox is required, **estimated effort:** hours to run Cell 12, archive HR tables, and produce one advisor-ready table — on Mac vs Rivanna?
 3. **Is Fine–Gray / explicit competing-risks Cox required** for parity with Dakota §4 prose, or is cause-specific Cox + binned stage 9 enough if prose is corrected?
-

B. Inference sample

4. **OpenAlex confidence policy** for analysis sample:

- HIGH only
- HIGH + MEDIUM
- Include MULTI with disclaimer

Which does Charles want locked for v1?

5. Is [R1_tenure_data.csv](#) / [faculty_panel_advisor.csv](#) the **canonical external share**, or will PEER produce a filtered “inference sample only” export? COMPASS needs one **release artifact** name.
 6. **168 schools:** Should manuscript say “168 R1 CS departments in panel” with inference-n footnote, or report a smaller **inference-ready N** prominently?
-

C. Scope freeze vs expansion

7. **Coverage expansion vs analysis lock-in:** Should near-term plan **freeze corpus** and run robustness on current 168, or resume aggressive URL/school scraping before manuscript?
 8. **Prestige controls (NRC/USNews):** Required for v1, beneficial, or defer?
 9. **Subfield heterogeneity:** Required for v1, beneficial, or defer?
-

D. Cross-domain parity

10. **What minimum parity with Army Cell 12** does PEER need? Same covariate structure (linear + quadratic pool + interaction with own performance)? List any deviations.
 11. **Can PEER deliver one paragraph of manuscript-ready results** (supported vs hedged) within 48 hours of Cell 12 run — or does VECTOR wait on longer robustness?
-

E. Infrastructure (planning only)

12. **Rivanna vs Mac:** Which environment should COMPASS assume for Cell 12 execution and notebook updates?
 13. **Known stale docs** beyond `VA_WEEKEND_CHECKLIST.md` flagged in PEER report?
-

Please answer in prose; numbered replies welcome.
