

AWS upload checklist — Army BDP v0.3

Submit from 520 root layout (`Network_1P_shell/` or equivalent). After upload, run from that same folder.

Files to include

talent/re_entry/ (whole folder)

- `army_gallery_paths.py` — paths + auto import bootstrap
- `army_basic_plots.py` — panels 2–4, 5, 6
- `army_act2_probes.py` — panels 7–8 (CCT + elite pond)
- `army_hero_slide_plot.py` — panel 9 (CR-aligned defaults)
- `build_army_data_story.py` — mosaic wrapper
- `run_army_bdp_pipeline.sh` — one-shot runner
- `army_pool_size_probe.py` — pool-size + TB-zero sensitivity probe
- `manifests/army_run1_3x3_manifest.json`
- `README.md` , `AWS_UPLOAD_CHECKLIST.md` (this file)
- `output/*/.gitkeep` (empty dirs OK)

sports/scripts/ (minimum)

File	Used by
<code>build_data_story_mosaic.py</code>	mosaic (updated REPO fallback)
<code>story_page_layout.py</code>	mosaic
<code>hero_plot_style.py</code>	BDP + HERO
<code>empirical_team_interval_overlap.py</code>	Panel 5 overlap
<code>hero_gallery_paths.py</code>	Required import for overlap module
<code>interval_overlap_paths.py</code>	Required import for overlap module
<code>gallery_mathtext.py</code>	Panel 5 overlap + Act II mathtext
<code>plot_provenance.py</code>	Act II bin badges (Q8, PW 3+5)

Optional (H_sort line in overlap title):

`sports/541_grandchild_homophily_assign.py` | Realized sorting index |

Also submit when pool-grain work is active

File	Why
<code>pipeline_config.py</code>	<code>POOL_GROUPING_MODE</code> , <code>POOL_EVAL_*</code> , <code>POOL_ANCHOR_COL</code> , <code>POOL_EXCLUDE_PEER_TB_ZERO</code> , eval dates in <code>base_time_varying_cols</code>
<code>add_cum_oer_metrics_mod_working.py</code>	Cell 5 <code>active_at_eval_thru</code> merge logic + peer TB-zero exclusion
<code>520_pipeline_cox_working.ipynb</code>	Cell 5: <code>pool_grouping_mode</code> , eval cols, <code>exclude_peer_tb_zero</code> + log lines (Mac canonical)

Do NOT re-submit unless changed

`big_dfs/*.feather` — regenerate on AWS after config/code updates.

After upload — three commands (520 root)

```
bash talent/re_entry/run_army_bdp_pipeline.sh
```

Or:

```
./talent/re_entry/army_basic_plots.py --all
./talent/re_entry/army_hero_slide_plot.py
./talent/re_entry/build_army_data_story.py
```

Make scripts executable if needed: `chmod +x talent/re_entry/*.py talent/re_entry/*.sh`

Success artifacts

- `talent/re_entry/output/data_story/ARMY_DATA_STORY_run1_3x3.png`
- `talent/re_entry/output/act2/ARMY_CCT_promotion_rate_pool_loo_run1_z1_2_q8.png`

- talent/re_entry/output/act2/ARMY_ELITE_pond_loo_pw3p5_run1_top20.png
- talent/re_entry/output/hero/ARMY_HERO_ew8_z_pool_minus_mean_snr_fwd_run1.png

Mosaic — nothing else required

Compositor needs only the manifest JSON + panel PNG paths + story_page_layout.py . Panel PNGs must exist before running build_army_data_story.py .

Panel 5 (overlap) — assortativity diagnostic

Uses all snapshot rows in the feather (not last-snapshot-only). Pool unit follows POOL_GROUPING_MODE in pipeline_config.py (same toggle as Cell 5). Performance axis = z_tb_ratio_fwd_snr when present.

Cell 11 export columns (in base_time_varying_cols , not Cox formula):

```
'snr_rater_bwd',
'eval_strt_dt_bwd',
'eval_thru_dt_bwd',
```

For active_at_eval_thru , re-run Cell 0 → Cell 11 after adding eval dates, then BDP. Confirm columns in df_pipeline_11_cox_analysis.feather before overlap.

Four subplots match MBB/tenure: coverage curve, span histogram, interval sample, full stack. High vertical coverage at a performance level ⇒ assortative overlap (many pools share that talent band).
